outer layer protein VP4 - bovine rotavirus A (serotype 5)

outer layer protein VP4

N,Alternate names: hemagglutinin; outer capsid protein VP4

N,Contains: outer layer protein VP5; outer layer protein VP8

N,Contains: outer layer protein VP5; outer layer protein VP8

C;Species: bovine rotavirus A requence revision 24-Feb-1994 #text_change 02-Jun-2000
C;Accession: JQ2022

R;Taniguchi, K; Urasawa, T; Urasawa, S.

J, Gen. Virol. 74, 1215-1221, 1993

The present sequence represents an epitope-bearing portion of human fibroblast growth factor-21 (FGF-21). FGF proteins regulate growth and differentiation of a variety of cell types. FGF-21 nucleic acids and polypeptides are useful for treating diseases and disorders characterised by inadequate numbers of hepatic cells, preferably cirrhosis of the liver. They may also be used in the treatment of infertility, impotence, and testicular cancer, as well as leukemia, lymphoma, autoimmune disease, or proliferative disorders of the thymus

```

The present invention describes an active variant (1) of a fibroblast growth factor (FGF) having at least one mutation in the beta-8-beta-9 crowth factor (FGF) having at least one receptor subtype compared to the corresponding wild type FGF by decreasing the biological activity the corresponding wild type FGF by decreasing the biological activity mediated by at least one receptor subtype while retaining the activity of execopathic and antiarthritic activities. (1) has cytostatic, vulnerary, osteopathic and antiarthritic activities. (1) can be used as a regulator of vasculogenesis or angiogenesis. (1) is useful for preparing a phormal FGF receptors (FGFRS), especially skeletal disorders, cancer, cabnormal FGF receptors (FGFRS), especially skeletal disorders, cancer, cabnormal FGF receptors (FGFRS), especially skeletal disorders, and wound healing processes. (1) is useful in detection and treatment of various FGFR related disorders including skeletal disorders e.g. achondroplasia, and osteoporosis, and cartilage defects, multiple bladder and cervical carcinoma. The novel mutants are useful in high expression systems unitable for pharmaceutical production, targeting of drugs or other agents to tissues and cells having special carcinoma of the formuse or other agents to tissues and cells having special carcinoma of and serve as template for the formation of improved agonists and activity and cancers. The presents a FGFR in various disorders and carcers and cancers. The presents a FGFR care structure amino acid antagonists of FGFRs in various disorders and care structure amino acid cancer. The present sequence represents a FGF core structure amino acid sequence which is given in the exemplification of the present invention New variants of fibroblast growth factor, useful for treating skeletal disorders including osteoporosis, malignancies and to enhance wound and Disclosure; Fig 1; 74pp; English fracture healing.

The sequence represents a fragment of a fibroblast growth factor-like (FGF-like) polypeptide. FGF-like protein and its associated nucleic acid play a role in modulating body growth, maturation or life-span. They are play a role in modulating by growth, maturation or life-span. They are considered to seem the second disease, mucositis, forbur's disease, cirrhosis, inflammatory bowel disease, mucositis, crohn's disease, cirrhosis, inflammatory bowel disease, mucositis, controllegenerative and iseases, damage to renal tubules as a result of acute tubular necrosis, has matopoietic cell reconstitution following chemotherapy, wasting syndromes (e.g., cancer associated cachexia), damage to the corneal cyndromes (e.g., cancer associated cachexia), damage to the corneal cyndromes (e.g., cancer associated cachexia), damage to the corneal cyndromes, myopathies, short stature maturation, alopecia, abnormalities of androgen target organs, premature maturation, alopecia, abnormalities of androgen target organs, bronchopulmonary dysplasia, acute respiratory distress syndrome, tumours of the eye or other tissues, atherosolerosis, hypercholesterolemia, stroke, osteoporosis, osteoarthritis, muscle atrophy, sarcopenia, cardiac function, immune system dysfunction, cancer, Parkinson's disease,

tresults in bone formation useful for treating bone defects, fractures, categorosis and other deficiencies in bone structure and formation.

Zeteoprosis and other deficiencies in bone structure and formation.

ZEGRII is useful for treating disorders associated with diabetes
mellitus, neural cell development or degeneration, amyotrophic lateral
consists, cerebrovascular stroke, neuropathy associated with lack of
maintenance of neuronal differentiation and congenital disorders of the
merintenance of neuronal differentiation and congenital disorders of the
merintenance of neuronal development, promoting angiogenesis
nervous system or lack of neuronal development, promoting angiogenesis
on wound healing, for revasuularisation in eps. complications related to
conform the conformation and dispetic food ulcers improving cardiac
conformation, modulating surfactant production in the lung epithelium, to
conformation production in the lung epithelium, to
conformation particularly in the heart or brain and for inducing skeletal
conformation of systemic and pulmonary hypertension. Antagonists of zegrii
conformation in the linhibiting disorders associated with kidney epithelium
                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the the proliferation of, or gene expression, in pericyte cells, for stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human blood, fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, fibroblast growth factor; FGF, zFGF11; mesenchymal cell; FGFRIIIc; osteoblastic lineage cell; diabetes mellitus; neuropathy; neural cell develbyment, amyotrophic lateral sclerosis; cerebrovagcular stroke; neuronal differentiation; congenital disorder; nervous system disorder; cardiac function; wound healing.
                                                                                                                                                                                                                                               One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.
                                                                                                                                                                                                                                                                                                                                                                               The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 RRO polymucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder.
                                                                                                                                      Gerritsen ME, Goddard A, Godowski PJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated human polypeptide (1) for zFGF11 (a fibroblast growth factor), and the encoding polynucleotide (II). (I) and (II) are used in methods of the invention stimulating proliferation of mesenchymal cells, detecting the presence of zFGF11 in a biological sample, detecting the presence of FGFRIIC in a biological sample and stimulating proliferation of osteoblastic lineage cells. The polypeptides, nucleic acid and/or antibodies of the invention may be used in treatment of disorders associated with diabetes mellitus, neural cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               development or degeneration, amyotrophic lateral sclerosis, cerebrovascular stroke, neuropathy associated with lack of maintenance of neuronal differentiation, and congenital disorders of the nervous system or lack of neuronal development. Molecules of the invention may also be useful for improving cardiac function and for promoting wound healing of the epidermis. The present sequence represents the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polypeptide for zFGFI1 (fibroblast growth factor) useful in treatment of disorders associated with diabetes mellitus, neural cell development or degeneration, amyotrophic lateral sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABO33743
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                             The present invention relates to new extracellular messenger polypeptides and polynuclectides encoding them. XMES is useful in the diagnosis, treatment and prevention of neurological disorders (e.g. epilepsy, stroke, or Alzheimer's disease), autoimmune/inflammatory disorders (e.g. educined immune deficiency syndrome, AIDS, Addison's disease, or allergies), developmental disorders (e.g. renal tubular acidosis, anaemia allergies), asyndrome), endocrine disorders (e.g. hypophysectomy, aneurysm or vascular malforantion), and cell proliferative disorders (e.g. cancer), and in the assessment of the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of extracellular messengers. XMES may also be used in the treatment of viral, bacterial, fungal, parasitic, protozoal and helminthic infections, trauma, disorders associated with hypopituitarism, hyperthyroidism or gonadal steroid hormones, and pancreatic disorders such as type II diabetes mellitus. The XMES may be used for somatic or germline gene therapy. The present

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnostis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU80739-ABU80860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; secreted and transmembrane protein; PRO; cytostatic; antiarthritic; osteopathic; gene therapy; TNF-Agonist-Alpha; chondrocyte stimulator; pericyte stimulator; fibroblast modulator; pharmaceutical; diagnostic; biosensor; bioreactor; tumour; lung tumour; oclon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; bone disorder; cartilage disorder; sports injury;

One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal.

The invention describes one hundred and eighty seven nucleic acids

Claim 11; Fig 78; 314pp; English

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide encoding sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the FRO polypeptides or polymucleotides are useful complexities. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour) in a mammal, for stimulating the release of TMF-alpha from human blood, for stimulating proliferation of pericyte cells, or for modulating colls, for stimulating proliferation of pericyte cells, or for modulating correcters (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, The PRO polypeptides are useful as molecular weight markers, or for chromosome also useful as molecular weight markers, or for chromosome canning libraries of human colls presence of those diseases. The PRO polypeptides are useful as hybridisation probes, or for screening libraries of human colls, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective control or transmembrane PRO polypeptide and no add sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                                                                                                                                                                                                                       encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenoisis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, fibroblast growth factor 21; FGF-21; chromosome 19; 19q13.1-qter; diabetes; obesity; antidiabetic; anorectic; type 2 diabetes; type 1 diabetes.

                                                                                                                                                                           The present sequence represents human fibroblast growth factor 21 (FGF-21). FGF-21 is located to chromosome 19, more specifically to 19q13.1-
cath. The present invention describes a method for treating a mammal exhibiting type 2 diabetes or type 1 diabetes, or treating a mammal cookesity which comprises administering to the mammal a composition cookesity which comprises administering to the mammal a composition comprising FGF-21 which has at least 95% amino acid sequence identity to the 20% amino acid sequence given in ABP96156. Also described: (1) inducing an increase in glucose uptake in adipocyte cells by administering FGF-21 to induce an increase in glucose uptake; and (2) administering a medicament for treating type 1 diabetes, type 2 diabetes cor obesity in a mammal using FGF-21 having 95% amino acid sequence identity to ABP96156. FGF-21 has antidiabetic and anorectic activities. The method is useful for treating a mammal exhibiting type 2 or 1 the method is preferably useful for treating a mammal for obesity. The method is preferably useful for treating to besity the method is preferably useful for besity the corresponding and for treating and mammal for type 2 diabetes, and for treating and mammal for obesity. The method is preferably useful for besity and for treating and mammal for type 2 diabetes, and for treating domestic animals for obesity

                                                                                                                                                                                                                                 The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in periorre cells or the release of TNF-alpha from human blood. Other possible uses include the atimulation or inhibition of chondrocyte proliferation or inhibition of chondrocyte proliferation or proliferation of mannation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Purthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention

acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tummour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tummour necrosis factor (TNF) alpha from human blood, the proliferation or differentiation of fondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention

WPI; 2003-492274/46. N-PSDB; ACD82214. New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes.

Claim 19; Fig 78; 315pp; English.

The invention relates to an isolated nucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate full length PRO cDNA. The PRO POLYpeptides are useful for chondrocyte stimulation, TNR-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of tumour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in

The present invention describes a method for the reduction of mortality and morbidity in critically ill patients, which involves the administration of fibroblast growth factor 21 (FGF-21) (1). (1) has cantiniflammatory, respiratory, antibacterial, immunosuppressive, vasotropic, haemostatic and nephrotropic activities, and can be used as a glucose level regulator, a glucose uptake stimulator, and an insulin esnsitivity enhancer. (1) can be used in the manufacture of a medicament for the reduction of morbidity and mortality in critically ill patients suffering from systemic inflammatory response syndrome (SIRS), respiratory distress, acute lung injury, acute respiratory distress acute lung injury, acute respiratory distress syndrome, multiple organ dysfunction syndrome, sepsis and chronic obstructive pulmonary disease (e.g. emphysema and chronic bronchitis). The SIRS includes pancreatitis, ischaemia, multiple trauma and tissue injury, haemorrhagic shock, immune-mediated organ injury, shock and renal

Use of fibroblast growth factor 21 for reduction of mortality and morbidity in patients suffering from e.g. systemic inflammatory response syndrome and acute respiratory distress syndrome.

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, auryival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are
                                                                                                                                                                                                                  0;
failure. FGF-12 regulates glucose levels in response to nutrient digestion; affects the overall metabolic state and counter-acts negative side effects that occur during the body's stress response to sepsis; reduces morbidity and mortality that occurs in critically ill patients; and stimulates glucose uptake and enhances insulin senativity. The present sequence represents the human FGF-21 amino acid sequence, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Goddard A, Godowski PJ;

received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the mamufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human, secreted and transmembrane protein, PRO; cytostatic; vulnerary; antiarthritic, pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF) -alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes an isolated PRO (secreted and transmembrane) polymeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polymeptide are useful for stimulating the proliferation of or gene expression in
                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Goddard A, Godowski PJ;

Novel human secreted and transmembrane protein PRO10196.

Human, secreted and transmembrane protein, PRO; cytostatic; vulnerary; antiarthritic; pericyte cell proliferation; pericyte cell differentiation; chondrocyte cell proliferation; chondrocyte cell differentiation; tumour necrosis factor alpha release; (TNF) - alpha release; dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; tissue typing; chromosome mapping; gene mapping; gene therapy.

```
The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

to useful for stimulating the proliferation of or gene expression in

periopte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

cells. PRO311, PRO357, PRO725, PRO1306 or PRO1419 polypeptide

cells. PRO311, PRO357, PRO725, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)-

are useful for stimulating the release of tumour necrosis factor (TMF)-

are useful for stimulating the release of tumour necrosis factor (TMF)-

(GETH) GENENTECH INC.

Gerritsen ME, Goddard A, Godowski PJ; Smith V, Stephan JF, Watanabe CK, Wood WI; Desnoyers L, Grimaldi JC, Baker KP,

2003-765525/72. WPI; 2003-765525, N-PSDB; ADB73214. New isolated PRO polypeptides useful as molecular weight markers in protein electrophoresis, useful for tissue typing, and for treating arthritis and tumors.

Claim 11; Fig 78; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

Cypyptide (I) PRO982, PRO1160, PRO1187 or PRO1392 polypeptide are

useful for stimulating the proliferation of or gene expression in

periove cells. PRO357, PRO212, PRO1272 or PRO4165 polypeptide are useful

cor stimulating the proliferation of differantiation of chondrocyte

cells. PRO357, PRO502, PRO3136, PRO1160, PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMF)
alpha from human blood. PRO982, PRO3197, PRO175, PRO1160, PRO1419, PRO214,

PRO147, PRO3137, PRO5126, PRO1065, PRO6109, PRO1061, PRO1161,

PROJES, PRO229, PRO788, PRO1194, PRO1272, PRO1468, PRO4302, PRO4408, PRO5723, PRO5725, PRO7154, or PRO7425 polypeptide are useful for inhibiting the proliferation of normal human dermal fibroblast cells. PRO polypeptides such as PRO6004, PRO4914, PRO5778, PRO5732, etc., are useful for detecting the presence of tumour in a mammal which involves comparing the level of expression of the above PRO polypeptides involves tample of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung is indicative of the presence of tumour in the mammal.
                                                                                                                                                                                                                                                                                                                                     tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or tumour, colon tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO157, PRO129, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             transmembrane PRO polypeptide.

2003-730024/69 N-PSDB; ADB84944 New PRO polypeptides and nucleic acids encoding the polypeptides, useful e.g. in gene therapy, disease diagnosis, chromosome identification and tissue typing.

Claim 11; Fig 78; 314pp; English

transmembrane polypeptides) and the PRO polymucleotides encoding them.
The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TRP) alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, in chromosome and gene mapping, in generating as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant creagents, in gene therapy, in chromosome identification, as chromosome reagents, in gene therapy, in chromosome identification, as chromosome condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartiage disorders (e.g. arthritis, sports injuries), involving inducing the re-differentiation of chondrocytes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention. ö Gaps ·; invention relates to human PRO polypeptides (secreted and Length 208; 0; Indels 100.0%; Score 89; DB 7; I 100.0%; Pred. The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them.

The PRO polypeptides and polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF)-alpha from human blood, for stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the proliferation of or gene capression in pericyte cells or for stimulating the proliferation of or gene normal human dermal fibroblasts. The PRO nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, in generating chordination probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful reagents, in gene therapy, in chromosome identification, as chromosome antibodies, are useful for preparing a medicament for treating a mainibodies, are useful for preparing a medicament for treating a mainibodies, and the sesponsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartiage antibodies, such as pericyte-associated tumours and bone and/or cartiage antibodies, such as pericyte-associated tumours and bone and/or cartiage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

The PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                               Gerritsen ME, Goddard A, Godowski PJ;

as New isolated PRO polypeptides, useful for tissue typing, gene therapy, molecular weight markers in protein electrophoresis, and for treating arthritis and tumors.

Claim 11; Fig 78; 308pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypeptides encoding them.

The PRO polypeptides and polymuclectides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours rectal tumour, colon tumour, breast tumour, colon tumour, breast tumour, colon tumour, breast tumour, colon tumour, breast tumour, colon tumour, breast tumour, colon tumour, rectal tumour or liver tumour) in a mammal, for stimulating the proliferation of diamulating the proliferation of condition probes, in crimulating the proliferation of conditions probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals of therapeutically useful reagenes, in chromosome and gene mapping, in generating probes. The PRO polypeptides by recombinant technology, in generating probes. The PRO polypeptides, or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the recombined and secular markers for protein electrophoresis, and in tissue typing. This equence represents a human PRO polypeptide of the invention.

WPI; 2003-657584/62. N-PSDB; ADB83813. New isolated polypeptides designated PRO polypeptides including polypeptides useful for stimulating the proliferation or differentiation of specific cell types, and for diagnosing cancer.

Claim 11; Fig 78; 314pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

Complypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

Complying the proliferation of or gene expression in

Complying the proliferation of or gene expression in

Complying the proliferation of deficientiation of chondrocyte

Complying PRO357, PRO229, PRO1152, PRO1419 polypeptide

Complying the proliferation or differentiation of chondrocyte

Complying the proliferation or differentiation of chondrocyte

Complying the proliferation or differentiation of chondrocyte

Complying the proliferation or differentiation of chondrocyte

Complying the proliferation or differentiation of chondrocyte

Complying the proliferation or proliferation of proliferation of proliferation or proliferation or downal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblasts cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the proliferation of normal human dermal fibroblast cells.

Complying the same cell type, where a higher level of expression of the presence of tumour in the mammal. The tumour is lung time indicative of the presence of tumour in the mammal. The tumour of tumour is lungur tumour.

Complying the promoter of t

transmembrane polypeptides) and the PRO polymucleotides encoding them.

The invertion relates to numman kWO polypeptides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, protect tumour, rectal tumour or liver tumour) in a mammal, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the proliferation of or gene chondrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene chordrocyte cells, for stimulating the proliferation of or gene expression in pericyte cells or for stimulating the proliferation of or gene chypridisation probes, in chromosome and gene mapping, in generating as they by bridisation probes, in chromosome and gene mapping, in generating transgenic animals or knock-out animals which may be used in the development and screening of therapeutically useful cragents, in gene therapy, in chromosome identification, as chromosome condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sporte injuries), involving inducing the redifferentiation of chondrocytes. The PRO polypeptides are useful as condition which has responsive to the PRO polypeptides are useful as condition which an arkers in the PRO polypeptides are useful as condition and process or anti-PRO confit some markers for protein electrophoresis, and in tissue typing. This condition who have a human PRO polypeptide of the invention.
One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, or for preparing a medicament for treating
                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides (secreted and

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymucleotides encoding them.

The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours rectal tumour colon tumour, breast tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) alpha from human blood, for stimulating the proliferation of differentiation of chondrocyte cells, for stimulating the proliferation of or gene chondrocyte cells, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of chondrocyte cells, for stimulating the proliferation of chondrocyte cells in chromosome and gene mapping, in generating transpanic animals of therapeutically useful reagents, in gene therapy, in chromosome indemnification, as chromosome completes, and in generating probes. The PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injures), involving inducing the recondition which is responsive to the PRO polypeptides or anti-PRO disorders (e.g. arthritis, sports injures), involving inducing the recondition energe and unana PRO polypeptides are useful as molecular markers for protein electrophoresis, and in tissue typing. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated PRO polypeptide useful for tissue typing, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goddard A, Godowski PJ;

The invention describes an isolated PRO (secreted and transmembrane)

CD polypeptide (1). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

Dericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

CD stimulating the proliferation of or gene expression in

CD stimulating the proliferation or differentiation of chondrocyte

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO351, PRO357, PRO1155, PRO1366 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF)-alpha from human blood. PRO982, PRO357, PRO725, PRO1306, PRO1419, PRO214, PRO337, PRO337, PRO526, PRO363, PRO531, PRO1083, PRO8400, PRO1080,
useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO127 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (1): PRO982. PRO1160, PRO1197 or PRO1329 polypeptide are useful for stimulating the proliferation of of onderfocyte cells. PRO357, PRO1292. PRO1292 or PRO4405 polypeptide are useful for stimulating the proliferation of differentiation of chondrocyte cells. PRO357, PRO352, PRO1272 or PRO4405 polypeptide are useful for stimulating the release of tumour necrosis factor (TMF) alpha from human blood. ```
The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

useful for stimulating the proliferation of or gene expression in

perioyte cells. PRO321, PRO1222, PRO1132, polypeptide are useful

for stimulating the proliferation or differentiation of chondrocyte

cells. PRO311, PRO357, PRO155, PRO1155, PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNP)-

alpha from human blood. PRO982, PRO351, PRO136, PRO1419, PRO1419

PRO131, PRO3134, PRO526, PRO353, PRO525, PRO1066, PRO1180,

PRO181, PRO229, PRO7184, or PRO1405 polypeptide are useful for atimulating the proliferation of normal human dermal fibroblast cells. PRO

polypeptides such as PRO6004, PRO4911, PRO1774, PRO5778, PRO4312, etc.,

are useful for detecting the presence of tumour in a mammal which

involves comparing the level of expression of the above PRO polypeptides

in a test sample of cells taken from the mammal, and a control sample of

cormal cells of the same cell type, where a higher level of expression of

the profile of the same cell type, where a higher level of expression of

cormal cells of the same cell type, where a higher level of expression of

the profile of the same cell type, where a higher level of expression of

cormal cells of the same cell type, where a higher level of expression of the same cell type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 208 AA;

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are
useful for stimulating the proliferation of or gene expression in

pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

for stimulating the proliferation or differentiation of chondrocyte

colls. PRO231, PRO357, PRO125, PRO1155, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TNF)-

alpha from human blood. PRO982, PRO357, PRO125, PRO1306, PRO1419, PRO214,

PRO247, PRO337, PRO526, PRO363, PRO531, PRO1081, PRO1419, PRO1412,

PRO1025, PRO1181, PRO826, PRO1005, PRO909, PRO1071, PRO1419, PRO1309,

PRO1026, PRO1330, PRO1347, PRO1305, PRO1927, PRO1274, PRO1320,

PRO10286, PRO1330, PRO1347, PRO1305, PRO144, PRO1279, PRO1340, PRO1322,

PRO1940, PRO6079, PRO9836 or PRO10096 polypeptide are useful for

stimulating the proliferation of normal human dermal fibroblasts cells.

PRO5723, PRO5725, PRO7154, or PRO7425 polypeptide are useful for

inhibiting the proliferation of normal human dermal fibroblast cells.

PRO5723, PRO5725, PRO7154, or PRO74081, PRO5778, PRO5778, PRO5732, etc.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid encoding a secreted and transmembrane polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy.

```
are useful for detecting the presence of tumour in a mammal which involves comparing the level of expression of the above PRO polypeptides in a test sample of calls taken from the mammal, and a control sample of normal cells of the same call type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polynucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful creating transgenic animals or knock-out animals which are useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and

WPI; 2003-765529/72. N-PSDB; ADC78024 Novel isolated PRO polypeptide useful for tissue typing, gene therapy, as molecular weight markers, for treating arthritis and tumor.

Claim 11; Fig 78; 308pp; English.

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (I). PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cealls. PRO357, PRO1299, PRO1210 or PRO4405 polypeptide are useful for stimulating the proliferation of differentiation of chondrocyte cells. PRO357, PRO925, PRO1315, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF) alpha from human blood. PRO982, PRO3157, PRO1306, PRO1419, PRO214, PRO1214, PRO1314, PRO986, PRO1080, PRO1418, PRO1314, PRO986, PRO1080, PRO1314, PRO1314, PRO1366, PRO10186, PRO1192, PRO1244, PRO1319, PRO1314, PRO1316, PRO1319, PRO1317, PRO1318, PRO1319, P transmembrane PRO polypeptide.

```
The invertion describes an isolated FVO Secreted and transmembrane)

polypeptide (I). PRO982, PRO1166, PRO1187 or ERO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO1259, PRO1250 or DRO4465 polypeptide are useful for stimulating the proliferation of of gene expression in for stimulating the proliferation of defendation of chondrocyte cells. PRO351, PRO357, PRO1355, PRO1306 or PRO1419 polypeptide are useful for stimulating the release of tumour necrosis factor (TME)-alpha from human blood. PRO924, PRO1357, PRO1305, PRO1411, PRO1411, PRO1411, PRO1414, PRO1414, PRO1414, PRO1414, PRO1414, PRO1414, PRO1347, PRO1364, PRO1364, PRO1364, PRO1367, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PRO1365, PR

(I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic animals or knock-out animals which are useful screening useful reagents. PROSS7, PRO2S9, PRO1S7 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
                                                                                                                                                                                                                                                                                                                                                                                New PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or as hybridization probes in chromosome and gene mapping.
                                                                                                                                                                                                         Gerritsen ME, Goddard A, Godowski ÞJ;

useful in gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, One hundred and twenty two nucleic acids encoding PRO polypeptides, e.g. cancer.

Claim 11; Fig 78; 314pp; English.

The Inventor describes an isolated FRO 1807 Elected and Lambshen describes an isolated FRO 1807 FRO 18 in a test sample of cells taken from the mammal, and a control sample of normal cells of the same cell type, where a higher level of expression of the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents. A polymucleotide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful for generating transgenic and mapping or gene therapy. (II) is useful screening useful reagents. PRO357, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, The invention describes an isolated PRO (secreted and transmembrane)

The invention describes an isolated rwo (secrete and transmembrane)

The invention describes an isolated rwo (secrete and transmembrane)

polypeptide (1). PRO982, PR01167 or PR01329 polypeptide are

useful for stimulating the proliferation of or gene expression in

Cor stimulating the proliferation or differentiation of chondrocyte

cells. PR0231, PR0357, PR0125, PR01155, PR01306 or PR01419 polypeptide

are useful for stimulating the release of tumour necrosis factor (TMP)-

alpha from human blood. PR0982, PR0317, PR0125, PR01306, PR01419, PR0214,

CR0447, PR0337, PR0256, PR0363, PR0531, PR0183, PR0340, PR0141, PR01309,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the PRO polypeptides in the test sample as compared to the control sample is indicative of the presence of tumour in the mammal. The tumour is lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour or liver tumour. (I) is useful as molecular weight markers, for tissue typing, or as therapeutic agents, A polynuclectide (II) encoding (I) is useful for chromosome and gene mapping or gene therapy. (II) is useful screening useful reagents. PROJS7, PRO229, PRO1272 or PRO4405 polypeptide is useful for treating bone and/or cartilage disorders (e.g., arthritis, sport injuries). This is the amino acid sequence of a human secreted and
polypeptide (PRO), for use in recombinantly producing a PRO polypeptide, as a hybridization probe, and in gene therapy.
                                                                                                                                                                                                                        invention describes an isolated PRO (secreted and transmembrane)

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypuble encoding them.

Cr The PRO polypeptides and polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours e.g. lung tumour, colon tumour, breast tumour, corposate tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TNF) alpha from human constituting the proliferation of differentiation of condrover cells, for stimulating the proliferation of condrover cells, for stimulating the proliferation of congene capturession in pericyte cells or for stimulating the proliferation of consmal human dermal fibroblasts. The PRO nucleic acids are useful as commal human dermal fibroblasts. The PRO nucleic acids are useful as comparating probes, in chromosome and gene mapping, in generating cartisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which the development and screening of therapeutically useful craspenses and in generating probes. The PRO polypeptides, or anti-PRO markers and in generating probes. The PRO polypeptides or anti-PRO antibodies, such as pericyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving the resonance condition which is responsive to the PRO polypeptides are useful as disorders (e.g. arthritis, sports injuries), involving inducing the resonance represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                      Novel isolated PRO polypeptide useful for tissue typing, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.
                                                                                                                                                                                                                                                            Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Human PRO polypeptide #39.

Human; PRO; secreted polypeptide; transmembrane polypeptide; tumour; cancer; lung; colon; breast; prostate; rectum; liver; tumour necrosis factor-alpha; TWF-alpha; blood; chondrocyte cell; pericyte cell; dermal fibroblast; bone disorder; cartilage disorder; arthritis; sports injury; cytostatic; antiarthritic.

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypucleotides encoding them.
The PRO polypeptides and polybucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, colon tumour, breast tumour, rectal tumour or liver tumour) in a mammal, for stimulating the release of tumour necrosis factor (TMF) -alpha from human constitution the release of tumour necrosis factor (TMF) -alpha from human constitution the proliferation of or gene capacity to stimulating the proliferation of or gene capacity in perioryte cells or for stimulating the proliferation of conditions probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant technology, in generating transgenic animals or knock-out animals which reagents, in gene therapy, in chromosome identification, as chromosome markers and in generating probes. The PRO polypeptides, or anti-PRO antibodies, such as perioyte-associated tumours and bone and/or cartilage condition which is responsive to the PRO polypeptides or anti-PRO antibodies, such as perioyte-associated tumours and bone and/or cartilage disorders (e.g. arthritis, sports injuries), involving inducing the rectilished cultur markers for protein electrophoresis, and in tissue typing. This equence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                      Gerritsen ME, Goddard A, Godowski PJ;

"Nucleotide sequence of capsid protein gene of porcine parvovirus.";

Virus Res. 13:79-86(1989)

Virus Res. 13:79-86(1989)

VII NONCAPRID PROTEIN NS-1.

-1- SUBUNIT: MATURA VIRON CONTAINS THREE CAPSID PROTEINS DESIGNATED CO. VP1, VP2, AND VP3 AND A NONCAPSID PROTEIN NS-1.

-1- MISCELLANBOUS: VP3 MIGHT BE A POSTTRANSLATIONAL CLEAVAGE PRODUCT OF VP2 IN SEVERAL AUTONOMOUS PARVOVIRUSES.

-1- SIMILARITY: Belongs to the parvoviruses coat protein family.
